

WHAT IS IT?

This is a 3 dimensionally moulded foam face mask, made in the UK, designed to prevent the transfer of droplets from and to the wearer.

This fluid barrier has excellent edge sealing characteristics giving high levels of protection to the wearer and surrounding contacts.

WHO IS IT FOR?

This mask is intended for those who risk coming into casual contact with occasional bursts of virus bearing droplets. Suitable for working environments such as warehouse, office, retail, transport and delivery services, education providers and manufacturing. ***It is not designed for intimate healthcare contact where single use, disposable masks destined for incineration would be most appropriate.***

ITS KEY BENEFITS...

- IT'S WASHABLE AND REUSABLE! Unlike paper masks which are discarded after 4 hours this foam mask can be washed and reused for up to 1 month before replacement.

- COMFORTABLE FIT. This mask is moulded to the contours of the human face including comfortable grips around the nose area - making a metal strap unnecessary. Elastic straps are provided to pull the mask towards the face and make the best seal around the edge consistent with comfort.

ACCREDITATION

This foam fluid barrier is designed to combat virus-bearing droplets by means of filtration via a complex pathway through the polyurethane matrix. Cough droplets are in a size range of 0.5-10 microns* with the majority in the 3-7 micron range. These can travel up to 7 metres from someone who coughs and are a principle method of infection transmission. (A micron is one thousandth of a millimetre).

Certified FFP2 & FFP3 masks have been in use for many years and are designed to operate across a range of industries. They are intended to filter a whole range of materials including very fine particulates as small as 0.06 microns.

This UK made mask has been designed for the purposes of **infection control only**, there is no mask certification that does not include a test for very fine particulates so this mask is advertised as a foam fluid barrier and not a dust mask.

DOCUMENTATION

This mask is currently offered on the basis of the manufacturers own Q.C tests and certificate of conformity. All in-house testing has been performed in line with EN149 test schedule and the results can be made available on request.
